## **Foreword**

Rainfall is the primary source of water and is of great importance for India's Economy, specially its agriculture industry. It is highly variable over space and time, leads to flood and drought every year on one or the other part of the country. Rainfall statistics is therefore required by the Policy Makers, Planners, Design Structure Engineers, Agriculturists, Hydrologists, Research Scholars and many more for proper management of water resources. Keeping in view the usefulness of rainfall statistics, the publication of rainfall statistics on annual basis was started 2012 onwards

It gives me great pleasure to present the '**Rainfall Statistics of India – 2014**' based on the rainfall received during the year and its comparison with normal rainfall based on the rainfall records for the period from 1951-2000.

I appreciate the authors for their painstaking efforts in bringing out this publication.

## **Preface**

India Meteorological Department is using the rainfall data received from a network of more than 3500 rain-gauge stations and prepares the rainfall statistics, both in tabular as well as in graphical form. The statistics is prepared for the administrative zones like districts, states and for the country. The statistics is also prepared for the 36 meteorological subdivisions and for the four broad regions (North West India, Central India, South Peninsula and, North & North East) of India. The rainfall is prepared at various temporal scales, like on weekly, monthly, seasonal and annual basis. Besides this, the hydromet division of IMD also monitors the subdivisional rainfall on daily basis during the monsoon season. Although, the current real-time rainfall products are uploaded on IMD website, the updated statistics is in most demand by various users. Hope, this publication containing updated rainfall statistics for the year 2014 would be useful for the users. Based upon the feed back from users, new information is added to the publication every year. The statistics of heaviest 1day rainfall recorded during monsoon season in each of the meteorological subdivision of India in tabular as well as in graphical form has been added to this year's publication.

We are thankful to Shri S. S. Hooda, Shri Rameshwar Ram, Shri Shiv Kumar Goel and Shri Manvir Singh of Rainfall Monitoring unit of Hydromet Division, New Delhi for their whole hearted contribution in bringing out this publication.

## INTRODUCTION

Rainfall is highly variable in time and space. Over 75% of the annual rainfall is received in the four rainy months of June to September only thereby leading to large variations on temporal scale. The average annual rainfall is 119 cm, but it has great spatial variations. The areas on the Western Ghats and the Sub-Himalayan areas in North East and Meghalaya Hills receive heavy rainfall of over 250 cm annually, whereas the Areas of Northern parts of Kashmir and Western Rajasthan receive rainfall less than 40 cm. The spatial distribution of annual normal rainfall has been depicted in the Figure 1. The two significant features of India's rainfall is that, in the north India, rainfall decreases westwards and in the Peninsular India, it decreases eastwards and then increases in the coastal region.

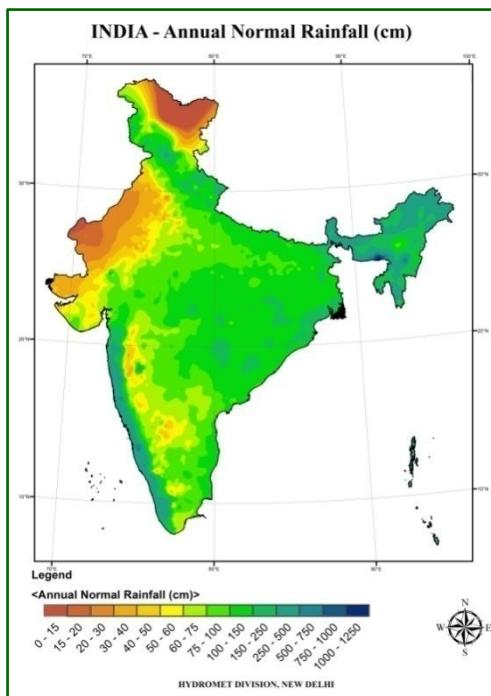

Figure 1: India - Annual Normal Rainfall

## METHODOLOGY

The rainfall statistics is computed based on the receipt of rainfall data from about 3500 stations spread over the entire country. Based on daily rainfall data of these stations, the rainfall of all the districts are computed and using the rainfall of the districts, rainfall statistics for the meteorological subdivisions, states, the four broad regions and for the whole country have been computed. The present publication includes the updated rainfall statistics for the country as a whole, for all the four broad regions of India, 36 Meteorological Subdivisions, all States and UTs and 641 Districts of India. The statistics is provided on monthly, 4 seasons i.e.Winter (Jan-Feb), Pre-Monsoon (Mar-May), Monsoon (may be referred as South West Monsoon) (Jun-Sep) and Post-Monsoon (Oct-Dec), and on annual basis. The Rainfall Normals used in this report are based on the rainfall records for the period from 1951-2000. Percent departures of rainfall from Rainfall Normals, besides these statistics, have been color coded as per their categories. Following is the list of categories, their corresponding ranges and color codes.

Category	Departures from Normals	Colour Code
Excess	20% or more	
Normal	-19% to +19%	
Deficient	-20% to -59%	
Scanty	-60% to -99%	
No Rain	-100%

## SALIENT FEATURES OF RAINFALL 2014

1. The country received annual rainfall of 88% of its normal rainfall of 118.6 cm and during SW monsoon season also, 88% of its normal rainfall of 89 cm.
2. During SW monsoon season, country experienced deficiency in rainfall as compared to its normal rainfall during the months of June (42%), July (10%) and August (9%). However, in September, it was 8% more than its normal rainfall.
3. The country was at maximum deficiency in rainfall of 33% during post monsoon season. However, it received normal rainfall during pre monsoon and excess (14%) during winter season.
4. All the four meteorologically homogeneous regions received less than their normal rainfall during monsoon season, post monsoon season and also annually.
5. In the four meteorologically homogeneous regions, highest positive departure of 88% was experienced in Central India during winter season where as highest negative departure of 69% was observed in East & North East India during post-monsoon season.
6. The country received maximum rainfall in the month of July as 261.1 mm and minimum in the month of December as 10.7 mm. However, on comparing with normals, it is observed that the maximum positive departure is of 24% from its normal rainfall in the month of February where as the maximum negative departure of rainfall was of 51% in the month of November.
7. Regionwise monthly rainfall - the maximum positive departure of 161% was recorded in Central India in the month of February, where as the maximum negative departure was of 83% in the months of November and December in East & North East India. However, the highest rainfall of 358.5 mm was recorded in the month of July in Central India and the least rainfall recorded was 2.3 mm in the month of December in East & North East India.
8. Subdivisionwise Seasonal & Annual rainfall - Coastal Karnataka received highest annual rainfall of 3563.9 mm and West Rajasthan received lowest annual rainfall of 302.4 mm. During the SW monsoon season, Coastal Karnataka received highest rainfall of 3116.7 mm and Haryana, Chandigarh & Delhi received lowest rainfall of 200.4 mm. Annually, all the subdivisions were either in Normal or in deficient category. During SW Monsoon season, only S. I. Karnataka recorded Excess rainfall with 20% departure and rest of the subdivisions were either in Normal or in Deficient category.
9. Annually, the District of East Khasi Hills in Meghalaya received the highest rainfall of 6293.1 mm where as the District Ladakh (Leh) in Jammu & Kashmir received the lowest rainfall of 34.7 mm.
10. Rainfall deficiency of 50% or more was experienced in 9% area of the districts of India. 24% area of districts was under rainfall deficiency between 25% and 50%. Remaining 64% area of the districts of India was with less than or equal to 25% rainfall deficiency or without any deficiency in rainfall.

11. During the South-West Monsoon season, rainfall deficiency of 75% or more was experienced in 9 districts, namely, Buxar (Bihar), Barnala (Punjab), Poonch (Jammu & Kashmir), Rohtak (Haryana), Kinnaur and Lahaul & Spiti (Himachal Pradesh), Ghaziabad and Gautam Buddha Nagar (Uttar Pradesh) and North West Delhi (Delhi). 76 districts of India out of 613 districts whose data was received during SW monsoon season, recorded deficiency in rainfall of 50% or more but less than 75%.

## **SEASONAL & ANNUAL RAINFALL STATISTICS FOR THE COUNTRY & BROAD REGIONS**

The country received annual rainfall of 88% of its normal rainfall of 118.6 cm and during SW monsoon season also, 88% of its normal rainfall of 89 cm. The region-wise and the country's seasonal and annual actual observed rainfall are given at [Table 1](#), and the percentage departures from normal rainfall are given at [Table 2](#). It may be observed that during monsoon season, post monsoon season and also annually, all the four regions received less than their normal rainfall. The country was at maximum deficiency in rainfall of 33% during post monsoon season. Regionally, highest positive departure of 88% was experienced in Central India where as highest negative departure of 69% was observed in East & North East India during post-monsoon season.

## **MONTHLY RAINFALL STATISTICS FOR THE COUNTRY & BROAD REGIONS**

The observed monthly rainfall for the country as a whole and also for the four broad regions of the country are given at [Table 3](#) and the % departures from normal rainfall are given at [Table 4](#). The country received maximum rainfall in the month of July as 261.1 mm and minimum in the month of December as 10.7 mm. However, on comparing with normals, it is observed that the maximum positive departure is of 24% from its normal rainfall in the month of February where as the maximum negative departure of rainfall was of 51% in the month of November. While, looking at the regions of India, it may be observed that, maximum positive departure of 161% was recorded in Central India in the month of February, where as the maximum negative departure was of -83% in the months of November and December in East & North East India. However, the highest rainfall of 358.5 mm was

recorded in the month of July in Central India and the least rainfall recorded was 2.3 mm in the month of December in East & North East India.

## SOUTH WEST MONSOON – 2014

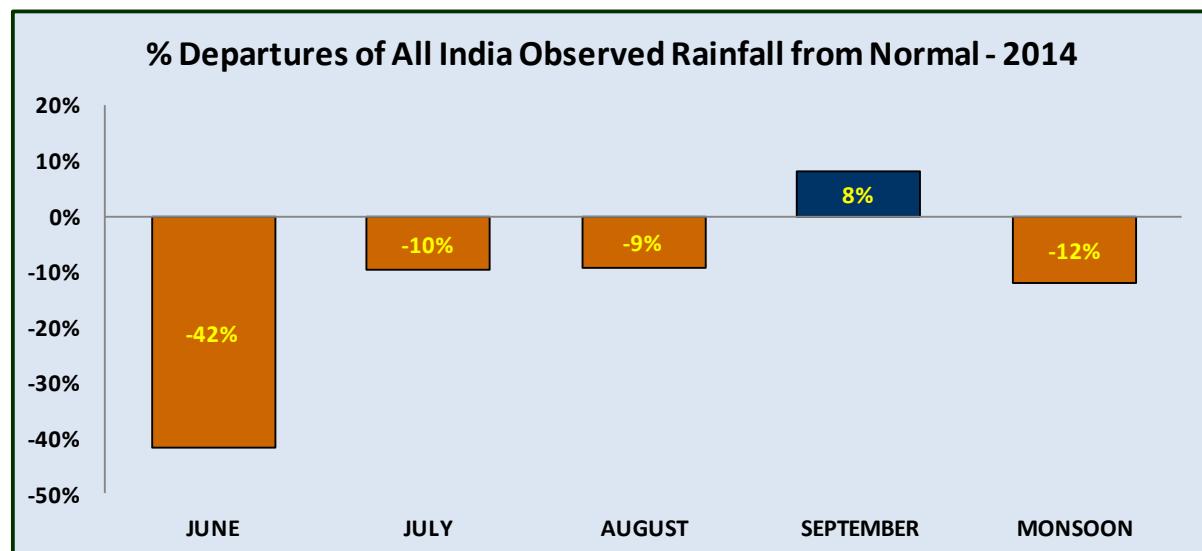

The rainfall statistics for monsoon months and season for the country is given at [Table 5](#). Also, the monthly and seasonal observed and normal rainfall and, the percent departures of observed rainfall from their normal rainfall have been depicted in charts at [Figure 2](#) and [Figure 3](#) respectively. During the monsoon season, country was deficient in rainfall at -12% departure from Normal. The striking feature of the SW monsoon season has been that, country received large deficiency in rainfall (42%) for the month of June where as for rest of the months it was within 10% of normal.

## SUBDIVISION-WISE SEASONAL & ANNUAL RAINFALL STATISTICS

Seasonal and annual observed rainfall statistics during the year 2014 for all the 36 meteorological subdivisions are given in [Table 7](#) and Subdivisional percent departures of rainfall have been given in [Table 8](#).

It may be observed from annual rainfall that Coastal Karnataka received highest rainfall of 3563.9 mm and West Rajasthan received lowest rainfall of 302.4 mm. During the monsoon season, Coastal Karnataka received highest rainfall of 3116.7 mm and Haryana, Chandigarh & Delhi received lowest rainfall of 200.4 mm. On comparing the annual rainfall with normals, it may be observed that, no subdivision remained in Excess or Scanty category. Annually, all the meteorological subdivisions remained either in Normal or in deficient category. During Monsoon season also, only S. I. Karnataka recorded excess rainfall with 20% departure from its Monsoon normal rainfall, rest of the subdivisions were either in Normal or in Deficient category.

Annual rainfall statistics for the year 2014 show that, 25 meteorological subdivisions remained in Normal and 11 in Deficient category of rainfall. The categorywise statistics and chart for seasonal distribution of no. of meteorological subdivisions have been given in [Table 9](#) and [Figure 10](#) respectively.

## **SUBDIVISIONAL AREA (%) UNDER RAINFALL DEFICIENCY – SW Monsoon 2014**

Area (%) of the 36 meteorological subdivisions of India under different categories of rainfall deficiency during SW monsoon (June-September) have been given below in tabular form in **Table 10** and has been depicted in graphical form in **Figure 12** as well.

During South-West Monsoon season 2014, three met. subdivisions i.e. West U.P., Haryana, Chandigarh & Delhi and Punjab recorded the rainfall that is less than 50% of its normal, with highest deficiency in rainfall of 57% in Haryana, Chandigarh & Delhi.

It may be observed (**Table 12**) that in the month of June, 30 meteorological subdivisions out of the 36 remained in Deficient/Scanty category and rest of the 6 were in normal category, particularly, all the met. subdivisions of North West India and Central India remained deficient or scanty. During the three post-monsoon months (October, November and December), all met. subdivisions of East & North East India experienced deficient/scanty rains or remained without any rains. During November, only 3 met. subdivisions Madhya Maharashtra, Marathwada and N. I. Karnataka were in Excess/Normal rainfall category and rest 33 met. subdivisions were in Deficient/Scanty/No Rain category. NMMT and Telangana remained in Deficient/Scanty rainfall category throughout the year except only for 2 months each, NMMT during August and September and Telangana during March

and May, when NMMT was in Normal and Telangana was in Excess rainfall category. Also, East U.P., West U.P. and Himachal Pradesh either recorded deficient or scanty rainfall or remained without any rains continuously for 6 months during the year.

## STATE-WISE SEASONAL & ANNUAL RAINFALL STATISTICS

Statewise seasonal and annual observed rainfall, and its percentage departures from normal rainfall for the states have been given in **Table 14** and **Table 15** respectively. It may be observed that during 2014, highest rainfall of 3491.2 mm was received at Goa and the lowest rainfall of 301.3 mm was received at Haryana. However, on comparing with Normal rainfall, it may be seen that, Karnataka received highest departure in rainfall of 8% from its normal where as Manipur was with highest deficiency of 52% of its normal rainfall. Goa recorded 7% departure in rainfall and Haryana remained at 46% deficiency in rainfall.

**## Rainfall Statistics for the state of Telangana was started June 2014 onwards after its bifurcation from Andhra Pradesh.**

It may be observed ([Table 15](#)) that, state of Nagaland and Manipur were Deficient/ Scanty for all the seasons as well as annually. On the contrary, Chhattisgarh and Karnataka recorded Excess/Normal rainfall for all the seasons and annually as well. During South West Monsoon season, all the states of North West India, except Jammu & Kashmir and Rajasthan remained either with deficient or scanty rains.

Annual rainfall statistics for the year 2014 show that, 24 states remained in Normal and 10 in deficient category of rainfall. Rainfall data for the states of Dadra & Nagar Haveli and Telangana (State was created in the month of June 2014) were not available for whole of the year. The statistics and chart of number of states in different categories for different seasons and for the year have been given at [Table 16](#) and [Figure 67](#) respectively.

## STATE-WISE MONTHLY RAINFALL STATISTICS

Statewise monthly observed rainfall and percentage departures of monthly rainfall for the states from their normal rainfall have been given in [Table 18](#) and [Table 19](#). It may be observed ([Table 19](#)) that in the month of June, all the state/UTs of North West India and Central India remained in Deficient/Scanty category of rainfall. Similarly, during the month of November, all the State/UTs of India except for the State of Maharashtra experienced deficient/scanty rains or remained without any rains. Maharashtra remained in Normal rainfall category. State of Manipur remained in Deficient/Scanty/No Rain rainfall category for all the months throughout the year. Also, Chandigarh (UT), Delhi (UT), Himachal Pradesh and Telangana either recorded deficient or scanty rainfall or remained without any rains continuously for 6 or more months, June onwards, during the year.

## DISTRICT-WISE SEASONAL & ANNUAL RAINFALL STATISTICS

The rainfall statistics is prepared for 641 districts of India. The districtwise observed seasonal and annual rainfall is given in [Table 21](#). Also the percent departures of observed rainfall from their normals have been given in [Table 22](#). It may be seen that the rainfall for some of the districts are not available, which is due to non-availability of data either by sudden developments of faults in the instruments or by remote/difficult locations of the stations in the districts. Annually, the District of East Khasi Hills in Meghalaya received the highest rainfall of 6293.1 mm where as the District Ladakh (Leh) in Jammu & Kashmir received the lowest rainfall of 34.7 mm, which resembles with the normal pattern of rainfall in India.

The categorywise seasonal and annual distribution of no. of districts of India has been given in [Table 23](#) and a chart depicting the distribution is also given at [Figure 71](#). It may be observed that in monsoon season as well as annually, almost half the districts out of the 641 districts experienced excess or normal rainfall. Annually, only 17 districts remained in Scanty category of rainfall. During post monsoon season, more than half the districts remained in Deficient/Scanty category.

**Table 23: Category-wise Number of Districts - Seasonally and Annually - Year 2014**

### AREA (%) OF DISTRICTS UNDER RAINFALL DEFICIENCY – SW Monsoon 2014

Area (%) of the 613 districts of India whose data received during SW monsoon (June-September) under different categories of rainfall deficiency have been given below in tabular form in Table 24 and has been depicted in graphical form in Figure 73 as well.

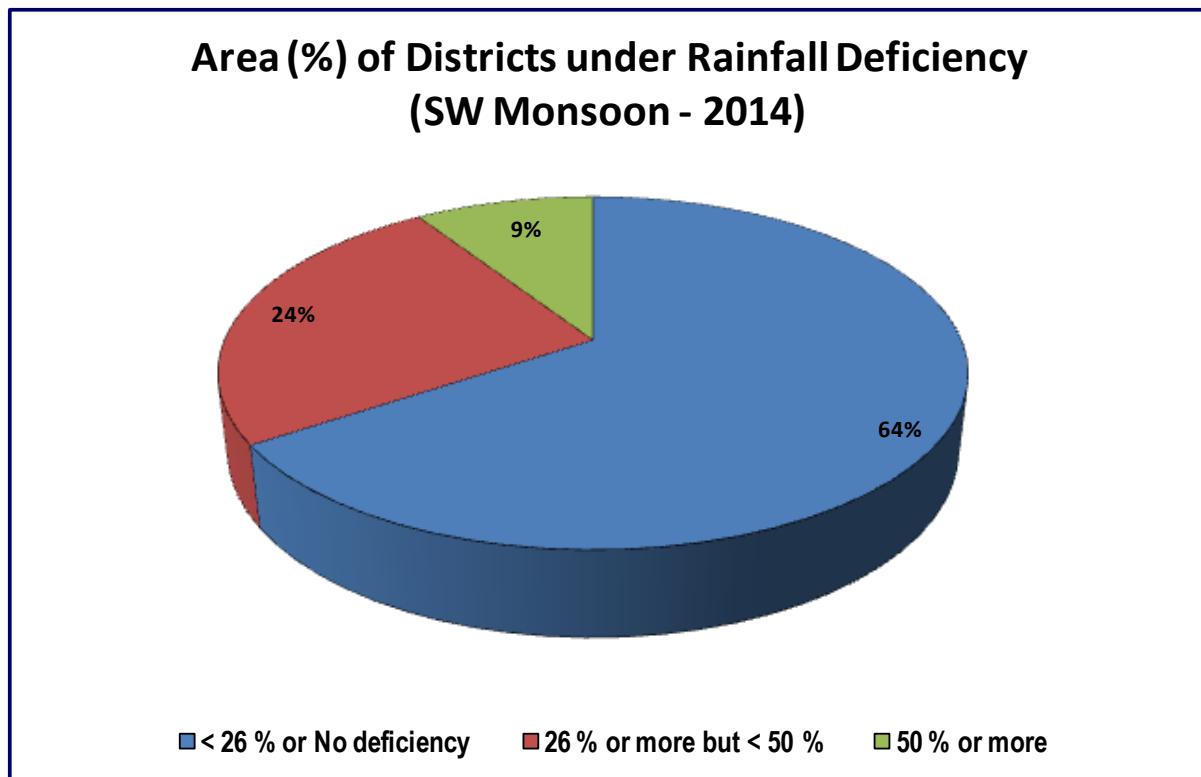

During the South-West Monsoon season, following 9 districts experienced rainfall deficiency of 75% or more.

- Buxar (Bihar)
- Barnala (Punjab)
- Poonch (Jammu & Kashmir)
- Rohtak (Haryana)
- Kinnaur and Lahaul & Spiti (Himachal Pradesh)
- Ghaziabad and Gautam Buddha Nagar (Uttar Pradesh)
- North West Delhi (Delhi)

In all, there were 76 districts of India that recorded deficiency in rainfall of 50% or more but less than 75%

Table 24: Area (%) of Districts of the country under Rainfall Deficiency - Monsoon 2014

Deficiency in Rainfall	% Area of Districts of India
< 26 % or No deficiency	64%
26 % or more but < 50 %	24%
50 % or more	9%

## ANNUAL AND MONSOON RAINFALL FROM 2000 TO 2014

The annual and monsoon rainfall and their departures from normal rainfall from the years 2000 to 2014 are shown in [Table 28](#) and [Figure 75](#) through [Figure 78](#). During last 14 years, the country

received annual rainfall of less than 5% of its normal rainfall. It was with positive departures only during 4 years in rest of the years, it was with negative departures. During the years 2000, 2002, 2009 2012 and 2014, the rainfall departures were more than 10% towards negative side. The maximum negative departure was 21% in the year 2002. Almost similar situation was observed during SW monsoon season where in the negative departures of more than 10% were observed during the years 2000, 2002, 2009 and 2014.

## RAINFALL NORMALS

Normal rainfall distribution is based on the rainfall recorded at 2412 locations all over the India during the period from 1951 to 2000. Network map of raingauges used for drawing the spatial patterns of normal rainfall has been given at Figure 79. Spatial distribution of normal rainfall for the monsoon season has been depicted in Figure 80.

## RAINFALL NORMALS - REGIONS, SUBDIVISIONS & STATES (Seasonal & Monthly)

The seasonal, annual and monthly rainfall normals for the country, four broad meteorological regions, meteorological subdivisions and for the states of India have been given below in the tables from [Table 29](#) through [Table 34](#). The rainfall normals are based on rainfall records for the period from 1951-2000.
